A global fleet. Real savings. Live deployment.

Following a successful trial, a major international operator with 20,000+ vehicles has signed a contract to roll out the advantage fuel-saving and emissions-reduction system across part of its fleet.

The results:

- 8%+ fuel cost savings
- Up to 18% CO₂ reduction (when operating on BioLPG)

Savings from month one. No capex required.

No new vehicles. No new infrastructure. Just immediate, measurable impact.

At a time of rising fuel costs and increasing pressure to decarbonise, solutions that deliver today — not in 5–10 years — are what matter.

This is another clear example of how existing fleets can unlock significant commercial and environmental value, right now.

If you operate a large fleet and want to reduce costs and emissions immediately, get in touch.
